Characteristics

Remark:

Reference level for the relative attenuation a_{rel} of the TFS 780 is the minimum of the pass band attenuation a_{min} . The minimum of the pass band attenuation a_{min} is defined as the insertion loss a_{e} . The centre frequency f_{C} is the arithmetic mean value of the upper and lower frequencies at the -3 dB filter attenuation level relative to the insertion loss a_{e} . The nominal frequency f_{N} is fixed at 780,0 MHz without tolerance. The given values for the relative attenuation a_{rel} and for the group delay ripple have to be reached at the frequencies given below even if the centre frequency f_{C} is shifted due to the temperature coefficient of frequency TC_{f} in the operating temperature range and due to a production tolerance for the centre frequency f_{C} .

^{*)} The terminating impedances depend on parasitics and q-values of matching elements and the board used, and are to be understood as reference values only. Should there be additional questions, do not hesitate to ask for an application note or contact our design team.
