

Description

The DFC10 Series provides power converter solutions to meet commercial and industrial requirements. With power densities above 11 watts per cubic inch (0.67 watts per cm³), overcurrent protection, and five-sided shielded case, the DFC10 meets the most rigorous needs in an industry-standard case size. The 220 kHz operating frequency of the DFC10 Series allows an increased power density while including adequate heat sinking and input/output filtering. This eliminates the need for external components in most applications. Full overload protection is provided by pulse-by-pulse current limiting.

Features

- RoHS lead-solder-exemption compliant
- High power density, up to 11 watts per cubic inch (0.67 watts per cm³)
- Efficiencies to 83% (Lower for 3.3V)
- Low input-to-output capacitance
- 700V isolation (1544V for 48V converters)
- Continuous overcurrent protection
- 3.3V output available
- 5-Sided, shielded copper case
- Extended input range (2:1)

Selection Chart				
Model	Input Range VDC (4)		Output VDC	Output mA
	Min	Max		
DFC10E12S3.3	9	18	3.33	2000

X.XXX dimensions: ±0.005 inches

Pin	Function
1	+INPUT
2	-INPUT
3	+OUT
4	NO PIN
5	-OUT

NOTES

(1) All parameters measured at Tc = 25°C, nominal input voltage and full rated load unless otherwise noted.

(2) The Case is tied to the -Input pin.

(3) The functional temperature range is intended to give an additional data point for use in evaluating this power supply. At the low functional temperature the power supply will function with no side effects, however, sustained operation at the high functional temperature will reduce expected operational life. The data sheet specifications are not guaranteed beyond the case operating range.

(4) The case thermal impedance is specified as the case temperature rise over ambient per package watt dissipated.

RMS Noise	TYP	6				mV_{rms}
Temperature Coefficient	TYP	50				ppm/°C
	MAX	150				
Short Circuit Protection from +OUT to -OUT		Continuous, Current Limit Protection				

NOTES

- (1) All parameters measured at $T_c = 25^\circ\text{C}$, nominal input voltage and full rated load unless otherwise noted.
- (2) Noise measurement bandwidth is 0-20 MHz for peak-peak measurements, 10 kHz to 1 MHz for RMS measurements. Output noise is measured with a $0.01\mu\text{F} / 100\text{V}$ ceramic capacitor in parallel with a $1\mu\text{F} / 35\text{V}$ Tantalum capacitor, 1 inch from the output pins to simulate standard PCB decoupling capacitance.
- (3) Short term stability is specified after a 30 minute warmup at full load, constant line and recording the drift over a 24 hour period.
- (4) The input ripple rejection is specified for DC to 120 Hz ripple with a modulation amplitude of 1% of V_{in} .

DFC10 SERIES APPLICATION NOTES

External Capacitance Requirements:

No external capacitance is required for operation of the DFC10 Series. If a capacitive input source is farther than 1" from the converter, an additional

capacitor may be required at the input pins for proper operation. This input capacitor should have an ESR greater than 0.25 ohms. Input capacitors with an ESR less than 0.25 ohms may cause peaking of the input filter and actually degrade circuit performance.

External output capacitance is not required for operation. However, it is recommended that $1\mu\text{F}$ to $10\mu\text{F}$ of tantalum and 0.001 to $0.1\mu\text{F}$ ceramic capacitance be selected for reduced system noise. Additional output capacitance may be added for increased filtering, but should not exceed $400\mu\text{F}$.

Negative Outputs:

A negative output voltage may be obtained by connecting the +OUT to circuit ground and connecting -OUT as the negative output.

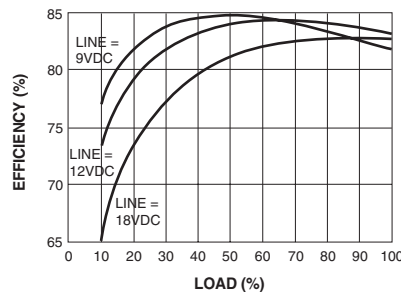

Typical Performance: ($T_c=25^\circ\text{C}$, $V_{in}=\text{Nom VDC}$, Rated Load)
